

Add Flex Box – Feature Requirements

This report describes the requirements for the new “**Add Flex Box**” option in the landing page editor.

1. Add Flex Box Option

attach_image01

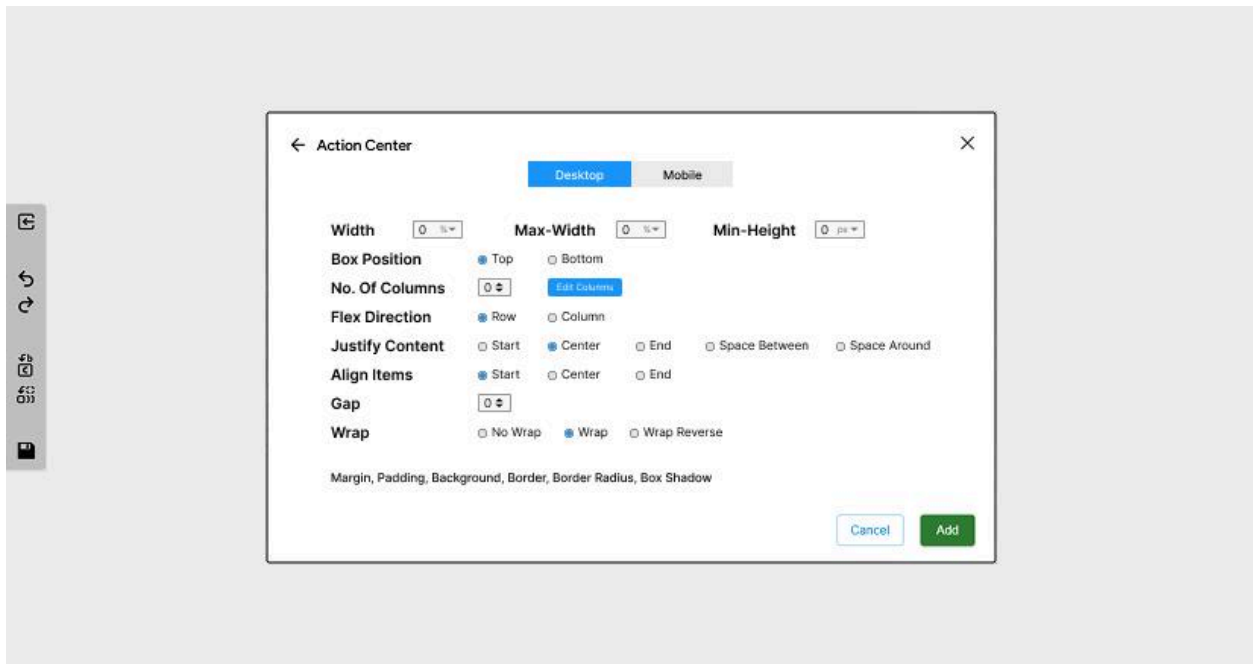

The above image shows the visual placement of the new “**Add Flex Box**” option in the element list.

When the user selects this option, the Flex Box configuration screen will open.

2. Flex Box Properties

attach_image02

The above image shows the configuration screen where the user can define the Flex Box properties.

There are two responsive sections:

- **Desktop**
- **Mobile**

I have used radio buttons in the example, but you can use a dropdown if that is more consistent with the existing **Add Element** and **Edit Element** interfaces.

Desktop Properties

Width

The user can define the Flex Box width.

Available units:

- %
- px

For example:

100% or 1200px

Max Width

The user can define the maximum width of the Flex Box.

Available unit:

- px

Min Height

The user can define the minimum height.

Available units:

- px
- vh

Box Position

This should work similarly to the existing **Add Element** process, where the user chooses where the new element should be inserted relative to the selected element.

Options:

- Top
- Bottom

Number of Columns

This determines how many columns the Flex Box will contain.

Available options:

1–6 columns

I suggest limiting the maximum number of columns to 6 to keep the layout manageable, especially on smaller devices.

After selecting the number of columns, an “**Edit Columns**” button should be available. The details of this option are explained in **attach_image04**.

Flex Direction

Standard CSS Flexbox option:

- Row
- Row Reverse
- Column
- Column Reverse

Justify Content

Standard Flexbox alignment option:

- Start
- Center
- End
- Space Between
- Space Around
- Space Evenly

Align Items

Standard Flexbox alignment option:

- Start
- Center
- End
- Stretch

Wrap

Standard Flexbox wrapping option:

- No Wrap
- Wrap
- Wrap Reverse

Gap

The user can define the gap between columns/items.

The user enters a numeric value and can select:

- %
- px

Other Basic Properties

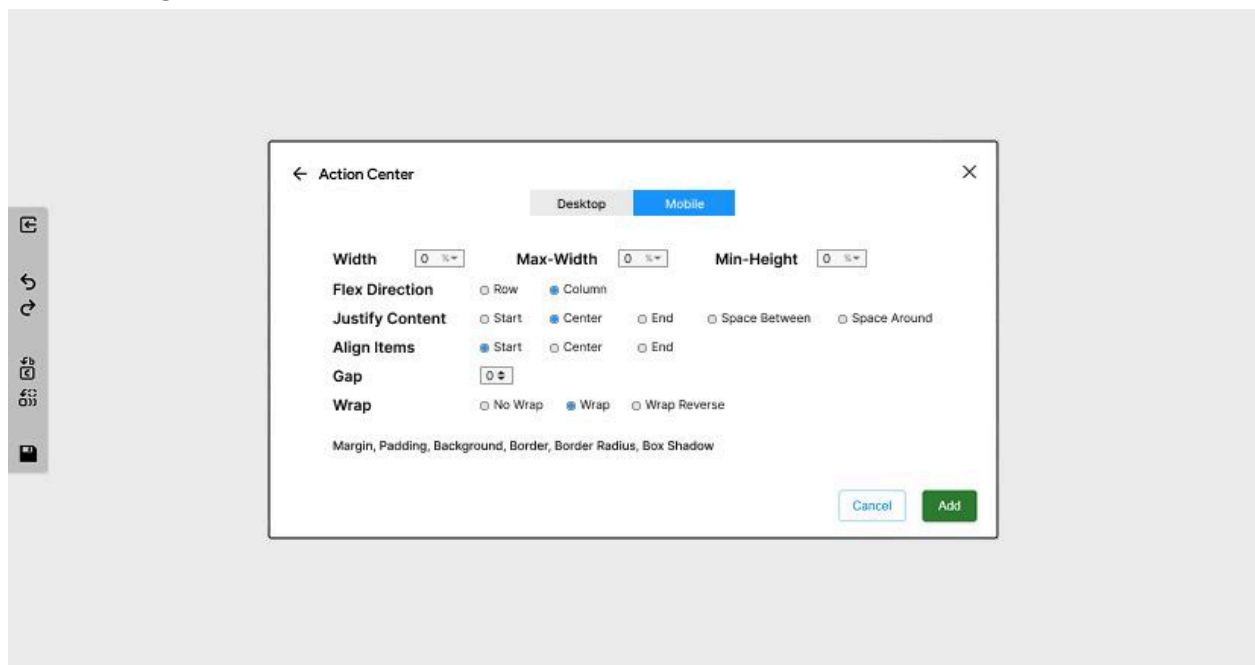

The Flex Box should also support the following basic styling properties:

- Margin

- Padding
 - Background
 - Border
 - Border Radius
 - Box Shadow
-

3. Mobile / Responsive Properties

attach_image03

The above image describes the responsive/mobile settings.

The same properties available for Desktop should also be available for Mobile, allowing the user to define different values for smaller screens.

For example, a Flex Box could have:

Desktop

3 columns

Mobile

1 column

The main point is that the Flex Box should be responsive and allow different settings for Desktop and Mobile.

Mobile Breakpoint

We need to define the breakpoint at which the Mobile settings become active.

My current suggestion is to use:

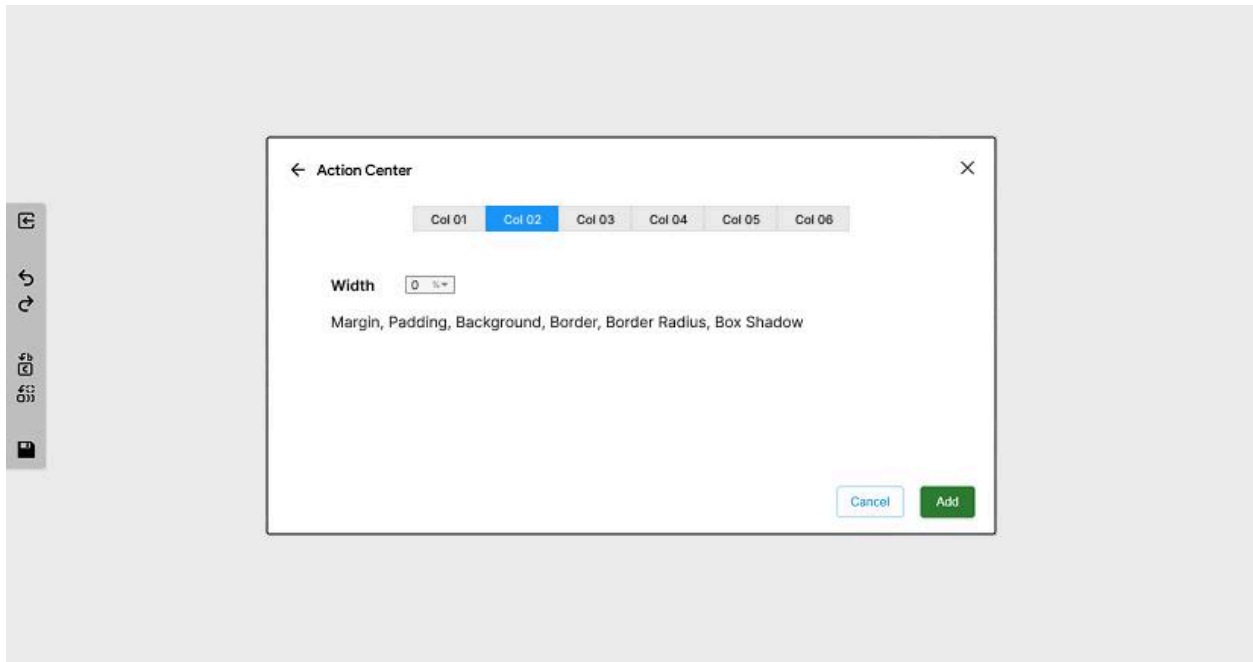

750px

So:

- Above 750px → Desktop settings
- 750px and below → Mobile settings

4. Edit Columns

attach_image04

The **Edit Columns** option allows the user to configure each individual column inside the Flex Box.

For example, if the user creates a Flex Box with 6 columns, they should be able to edit the properties of each column separately.

Each column should have the following properties:

- Width
- Margin
- Padding
- Background
- Border
- Border Radius
- Box Shadow

Column Width

The width should support:

- %
- px

This allows users to create both equal and custom-width layouts.

For example:

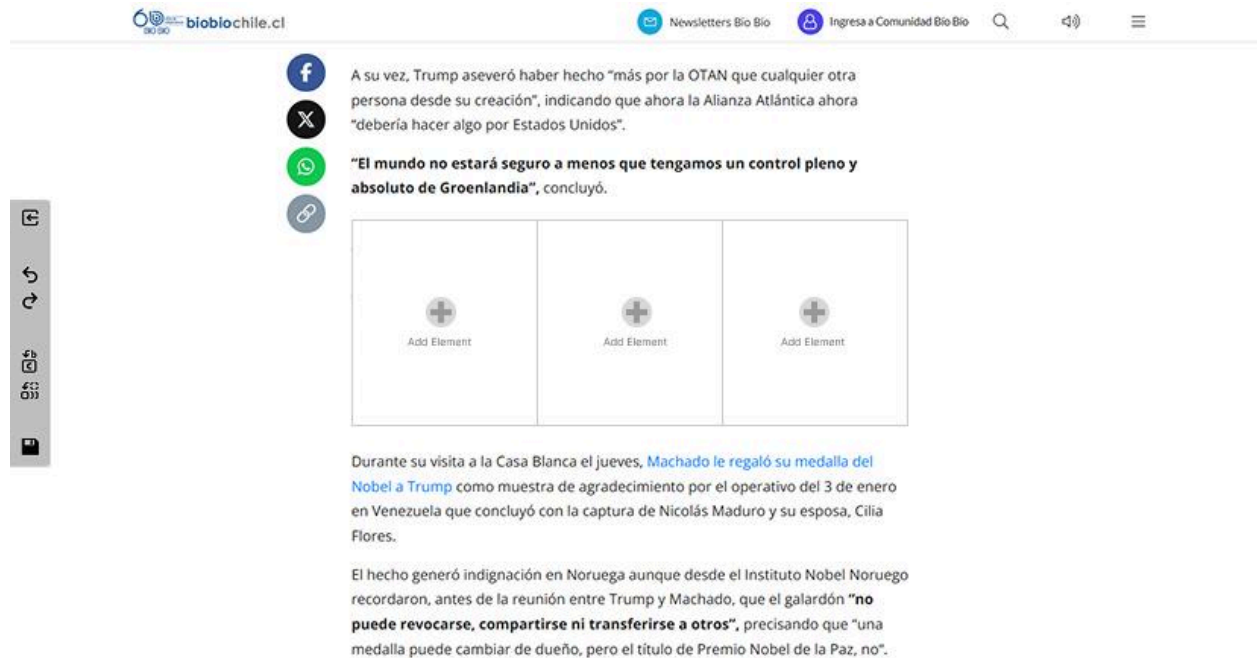

50% / 50%

or:

40% / 30% / 30%

5. Add Element / Add Flex Box Inside Columns

attach_image05

After a Flex Box is created, each column should provide an **Add Element / Add Flex Box** option.

This allows users to place content inside individual columns.

The add icon should:

- Appear only when the column is empty.
- Be visible only when the landing page is opened in the editor.
- Allow the user to add either an element or another Flex Box inside that column.

For example:

Flex Box

- Column 1 → Add Element
- Column 2 → Add Element
- Column 3 → Add Element

Once content has been added to a column, the empty-column add icon should no longer be displayed.

6. Notes

These are the initial requirements for the **Add Flex Box** feature.

I may still identify some points that need improvement while testing the feature, especially around responsive behavior and the column editing interface.

For now, I suggest implementing the basic structure first, and we can refine or improve specific points during testing.

If anything in this report is unclear or you have any questions about the requirements, please feel free to ask.

Thank you so much!
